

Quest Storage Suite for Exchange

CONTROL E-MAIL STORAGE

"More intelligent methods of dealing with storage often yield efficiencies in operational procedures and result in financial gain."

— Kieran McCorry, Microsoft Exchange MVP, Best Practices for Exchange Storage Management

The Quest Storage Suite for Exchange includes:

- MessageStats
- Archive Manager for Exchange
- Recovery Manager for Exchange

Every day, organizations rely on e-mail to send, receive, and store critical business information. With this dependency on e-mail comes a new challenge for Exchange administrators: how do organizations store and manage e-mail in the long term?

Exchange administrators must have the ability to manage e-mail storage growth, policy enforcement, archiving, and other related issues. Managing large, active stores of messaging information can take up administrators' time, and failures cause long outages, which can impact businesses with lost productivity and can impact time-critical business deals.

Quest Storage Suite for Exchange enables organizations to efficiently manage and control messaging data.

Exchange Usage Analysis

Perform mission-critical traffic analysis and reporting using Quest MessageStats™. MessageStats provides business- and technical-focused reports based on comprehensive data gathered from the entire Exchange organization and optimized in SQL-based storage. MessageStats provides insight into service delivery times, traffic flow, storage capacity, inventory, financials, and e-mail usage so that organizations can manage Exchange to meet strategic objectives.

E-mail Archiving

Quest Archive Manager enables e-mail to become a true asset for the organization by capturing, indexing, and storing messaging data for mailbox management, compliance, litigation support and knowledge sharing. Archive Manager helps organizations to control message data volumes, reduce the cost associated with storage management and quickly produce evidence for compliance and legal purposes. Through secure information sharing, Archive Manager empowers organizations to access and leverage the knowledge locked up in e-mail.

Message Recovery

Discover and recover messages quickly using Quest Recovery Manager for Exchange. Recovery Manager for Exchange allows individual, message-level items, including e-mails, appointments, tasks, contacts, and attachments to be restored from regular Exchange backups and un-mounted .edb information stores without setting up a dedicated Exchange recovery server. Organizations can reduce the cost of e-discovery in addition to providing end users with message-level data recovery services.

MessageStats

Customizable At A Glance Dashboards: Find information fast using enterprise reporting dashboards. Customize reports with over 400 graphs and tables representing every aspect of Exchange operations.

Executive Summary Reports: MessageStats provides top-level metrics to confirm operational success in service delivery, understand messaging system traffic and capacity, and model financials for your Exchange environment.

Business Unit Reporting: Use MessageStats to understand how e-mail facilitates your corporate objectives. Multiple reporting perspectives provide business-focused Exchange data at many levels.

Archive Manager

ZeroIMPACT Archiving: Archive Manager captures and manages new and historical messaging data transparently to end users.

Controlled Access to Data: Granular permissions to the archives ensure that data is secured, and also enables organizations to share business intelligence.

Comprehensive Data Discovery: Archive Manager allows organizations to consistently manage data with searching and reporting tools to easily discover items previously only available to end users.

Single-instance Storage: Archive Manager stores a single copy of all messages and attachments, reducing the space needed to store e-mail messages.

Improved Performance and Stability: Archive Manager reduces the storage volume of e-mails and the load on your messaging servers.

Recovery Manager for Exchange

Message-Level Recovery: Restore selective mailbox content—including e-mail messages, contacts, public folders, notes, calendar entries, and attachments—to a specified location, without disrupting the existing mailbox content.

No Need for a Recovery Server: Easily search, select, and restore messages without setting up and managing an Exchange recovery server. This saves both time and hardware resources.

Backup Support: Recover content from full, incremental, or differential backups, including regular Exchange backups, offline .edb files, and MTF-compliant backup tapes. Recovery Manager minimizes storage space, cost, effort and time restoring backups, eliminating the need to modify backup procedures.

Powerful Search Engine: Any combination of search criteria can be used to find content in a single mailbox, single folder, or all mailboxes in an information store. Search results can be selected and restored directly from the search results list.
